1. The Danube River port of Komarno was very important, due mainly to the shipbuilding and repair facilities and iron ore unloaded there. Although there was one ship factory located there, a new factory was started which was about 10 times as large. It was planned to build river ships up to 60 meters in length. The iron ore unloaded at Komarno was destined to the huge steel plant at Moravska Ostrava.
2. The bridges across the Danube and winter port accommodated both railroad and vehicular traffic.
3. The one-story warehouses were used for temporary storage of fresh foods, wine, tobacco and dry goods.
4. ~~The attached sketch shows the location of the port area.~~
[Available at the CIA Library is a sketch map of the Komarno Port area prepared by source.]
